# **FUC Documentation**

***Release 0.1.0***

**Pingjun Chen**

**Dec 27, 2022**

# COMMANDS

<b>1</b>	<b>Commands Basics</b>	<b>3</b>
1.1	Help commands . . . . .	3
1.2	Environment variables . . . . .	3
1.3	History commands . . . . .	3
1.4	Directory change . . . . .	3
1.5	Download from the internet . . . . .	4
<b>2</b>	<b>Git Commands</b>	<b>5</b>
2.1	Delete branch . . . . .	5
2.2	Tag . . . . .	5
2.3	Remote . . . . .	5
<b>3</b>	<b>File Operations</b>	<b>7</b>
3.1	Find files contain specific text . . . . .	7
3.2	Check specific lines inside a text file . . . . .	7
3.3	Get number of all files . . . . .	7
3.4	Storage usage . . . . .	7
3.5	Check size of all subdirectories . . . . .	8
3.6	Searches directory recursively in subdirectories . . . . .	8
3.7	Searches file recursively in subdirectories . . . . .	8
3.8	Delete file/directory recursively in subdirectories . . . . .	8
<b>4</b>	<b>Docker Management</b>	<b>9</b>
4.1	Docker Installation . . . . .	9
4.2	Image management . . . . .	9
4.3	Container management . . . . .	9
4.4	Upload image to docker hub . . . . .	10
4.5	Convert image to singularity . . . . .	10
<b>5</b>	<b>User Management</b>	<b>11</b>
5.1	Add user with full profile . . . . .	11
5.2	Add user with only name . . . . .	11
5.3	Add user to sudo group . . . . .	11
5.4	List all user names . . . . .	11
<b>6</b>	<b>Compression Operations</b>	<b>13</b>
6.1	Tar and untar . . . . .	13
6.2	Compress and uncompress . . . . .	13
<b>7</b>	<b>Process Management</b>	<b>15</b>
7.1	Check process . . . . .	15

7.2	Kill process . . . . .	15
7.3	Check Ubuntu version . . . . .	15
<b>8</b>	<b>Seadragon</b>	<b>17</b>
8.1	Login Seadragon . . . . .	17
8.2	Interactive Running . . . . .	17
8.3	Load Modules . . . . .	17
8.4	Start Singularity Instance . . . . .	17
8.5	More Useful Commands . . . . .	18
<b>9</b>	<b>Conda Env</b>	<b>19</b>
9.1	List available envs . . . . .	19
9.2	Create env . . . . .	19
9.3	Activate env . . . . .	19
9.4	Deactivate env . . . . .	19
9.5	Remove env . . . . .	19
<b>10</b>	<b>Virtual Env</b>	<b>21</b>
10.1	Installation . . . . .	21
10.2	Create virtual environment . . . . .	21
10.3	Activate environment . . . . .	21
10.4	Deactivate the environment . . . . .	21
<b>11</b>	<b>tmux</b>	<b>23</b>
11.1	Installation . . . . .	23
11.2	List available sessions . . . . .	23
11.3	Start new session . . . . .	23
11.4	Attach to session . . . . .	23
11.5	Kill session . . . . .	23
<b>12</b>	<b>sftp</b>	<b>25</b>
12.1	Login to server . . . . .	25
12.2	File transfer . . . . .	25
12.3	Command . . . . .	25
12.4	Exit server . . . . .	26
<b>13</b>	<b>apache</b>	<b>27</b>
13.1	Restart . . . . .	27
13.2	Check error log . . . . .	27
<b>14</b>	<b>About FUC-CHEN</b>	<b>29</b>

- *Commands*
- *About*

## COMMANDS BASICS

### 1.1 Help commands

```
$ man <command> # man page
$ whatis <command> # whatis
$ <command> -h # option -h
```

### 1.2 Environment variables

Create variable in shell

```
$ <env_var>="var_value" $ export <env_var>
```

Define variable in bash configuration file

```
export <env_var>="var_value" # add the setting to ~/.bashrc
```

```
source ~/.bashrc # load new environment variables to shell
```

Print variable

```
$ echo ${<env_var>} $ printenv <env_var>
```

### 1.3 History commands

```
$ history # check recent commands
```

```
$ history | grep <string> # find previous command with specific string
```

### 1.4 Directory change

```
$ pwd # check current directory
```

```
$ cd ~ # go to home directory
```

```
$ cd - # go to previous directory
```

```
$ cd .. # go to parent directory
```

## 1.5 Download from the internet

```
$ wget <url>
```

```
$ curl <url>
```

## GIT COMMANDS

### 2.1 Delete branch

Delete local branch

```
$ git branch -D <branch_name>
```

Delete remote branch

```
$ git push <remote_name> --delete <branch_name>
```

### 2.2 Tag

Add tag to current submit

```
$ git tag -a <tag_name> -m <comment>
```

List all tags

```
$ git tag -l
```

Delete local tag

```
$ git tag -d <tag_name>
```

Delete remote tag

```
$ git push --delete origin <tag_name>
```

### 2.3 Remote

Set up upstream remote

```
git remote add upstream https://github.com/repo
```

Update local repo

```
git pull upstream <branch_name>
```

Push to upstream

```
git push upstream <branch_name>
```

## FILE OPERATIONS

### 3.1 Find files contain specific text

```
$ grep -rin <text> .
```

### 3.2 Check specific lines inside a text file

```
$ sed -n <start_line_num>:<end_line_num>p <text_file>
```

### 3.3 Get number of all files

When number of file is small, less than 10,000

```
$ ls -ls *.<ext> | wc -l
```

When more than 10,000 files

```
$ find -type f -name '*.<ext>' | wc -l
```

### 3.4 Storage usage

Check disk partition usage

```
$ df -h
```

Check the size of a directory

```
$ du -hs <directory>
```

### 3.5 Check size of all subdirectories

```
$ du -hs *
```

### 3.6 Searches directory recursively in subdirectories

```
$ find . -type d -name <directory>
```

### 3.7 Searches file recursively in subdirectories

```
$ find . -type f -name <file>
```

### 3.8 Delete file/directory recursively in subdirectories

```
$ find . -name <file/directory> -exec rm -rf {} ;
```

## DOCKER MANAGEMENT

**Docker** is an open platform for developers and sysadmins to build, ship, and run distributed applications, whether on laptops, data center VMs, or the cloud.

### 4.1 Docker Installation

```
$ sudo apt install docker.io      # install docker
$ sudo usermod -aG docker $USER  # add user to docker group
```

### 4.2 Image management

Create **image** from **Dockerfile**

```
$ docker build -t <image_name>:[tag_name] .
```

Create **image** from a specific Dockerfile

```
$ docker build -f <dockerfile_name> -t <image_name>:[tag_name] .
```

Image management

```
$ docker save <image_name>:[tag_name] <image_name>.tar  # save image
$ docker load --input <image_name>.tar                # load image
$ docker images                                         # list available images
$ docker rmi <image_name>                              # remove image by name
$ docker rmi <image_id>                                # remove image by id
$ docker images purge                                  # remove dangling images
```

### 4.3 Container management

Start container

```
$ docker run -it --restart always --name <container_name> <image_name>:[tag_name]
Options:
  -v <local_dir>:<docker_dir>:ro      # map local directory to docker
  --runtime=nvidia                    # expose NVIDIA GPUs
  -e NVIDIA_VISIBLE_DEVICES=5         # cuda device setting
```

(continues on next page)

(continued from previous page)

```
--shm-size 16G      # set size of shared memory
--rm                 # remove container file system when exits
```

Copy files

```
$ docker cp <container_name>:<src_dir> <local_dst_dir> # copy files from docker to local
$ docker cp <local_src_dir> <container_name>:<dst_dir> # copy files from local to docker
```

Container management

```
$ docker ps          # list all available containers
$ docker stop <container_name> # stop specific container
$ docker rm <container_name>   # remove specific stopped container
```

## 4.4 Upload image to docker hub

Login to docker hub

```
$ export DOCKER_ID_USER="user_name" # set docker hub username
$ docker login                       # login in to docker hub
```

Tag image

```
$ docker tag <image_name>:<version> $DOCKER_ID_USER/<image_name>:<version>
```

Push to docker cloud

```
$ docker push $DOCKER_ID_USER/<image_name>:<version>
```

## 4.5 Convert image to singularity

Create docker image tarball

```
$ docker save <image_name>:<version> -o <image_name>.tar
```

Build singularity from image tarball

```
$ singularity build <image_name>.sif docker-archive://<image_name>.tar
```

Build singularity from DockerHub image

```
$ singularity pull <image_name>.sif docker://<user_name>/<image_name>:<version>
```

## USER MANAGEMENT

### 5.1 Add user with full profile

```
$ adduser <username>
```

### 5.2 Add user with only name

```
$ useradd <username>
```

### 5.3 Add user to sudo group

```
$ usermod -aG sudo <username>
```

### 5.4 List all user names

```
$ compgen -u
```

Delete user

```
$ userdel -r <username>
```

## COMPRESSION OPERATIONS

### 6.1 Tar and untar

Create tar archive File

```
$ tar -cvf tar-archive-name.tar <source>
```

Untar files in current directory

```
$ tar -xvf tar-archive-name.tar
```

Untar files to a specific directory

```
$ tar -xvf tar-archive-name.tar -C <destination>
```

List content of tar archive file

```
$ tar -tvf tar-archive-name.tar
```

### 6.2 Compress and uncompress

Compress folder to tar.gz

```
$ tar -czvf tar-archive-name.tar.gz <source>
```

Extract a tar.gz compressed archive

```
$ tar -xzvf tar-archive-name.tar.gz
```

Compress folder to tar.bz2

```
$ tar -cjvf tar-archive-name.tar.bz2 <source>
```

Extract a tar.bz2 compressed archive

```
$ tar -xjvf tar-archive-name.tar.bz2
```

## PROCESS MANAGEMENT

### 7.1 Check process

View your system's resource usage and see the processes that are taking up the most system resources.

\$ top

Improved top

\$ htop

### 7.2 Kill process

By process id

\$ kill -9 <pid>

By application name

\$ pkill <app>

By filtering conditions

ps -ef | grep <command> | awk '{print \$<col\_num>}' | xargs kill -9

### 7.3 Check Ubuntu version

\$ lsb\_release -a

## SEADRAGON

Seadragon is a supercomputing resource of MD Anderson's High Performance Computing (HPC), which is dedicated for use by the research community.

### 8.1 Login Seadragon

```
$ ssh seadragon
```

### 8.2 Interactive Running

```
# cpu interactive
$ busb -Is -q interactive -W 1:00 -M 64 -R rusage[mem=64] -n 4 /bin/bash
# gpu interactive
$ busb -Is -q gpu-medium -gpu num=1:gmem=16 -W 3:00 -M 64 -R rusage[mem=64] -n 10 /bin/
↪ bash
```

### 8.3 Load Modules

```
$ module load singularity/3.5.2
$ module load cuda10.1/toolkit/10.1.243
```

### 8.4 Start Singularity Instance

```
$ singularity run --nv --bind <local_dir>:<container_dir> <singularity_path> <program>
```

## 8.5 More Useful Commands

```
$ bsub < <lsf_script> # submit job via script
$ bjobs -u all | more # check all running jobs
$ bjobs -u all | grep gpu # check all gpu jobs
$ bjobs -p # show all pending jobs
$ bjobs -l xxxxxxxx # check the details of one specific job
$ bkill -l xxxxxxxx # kill one specific job
```

**CONDA ENV****9.1 List available envs**

```
$ conda info --envs
```

**9.2 Create env**

```
$ conda create --name <env_name> python=3.6
```

**9.3 Activate env**

```
$ source activate <env_name>
```

**9.4 Deactivate env**

```
$ source deactivate
```

**9.5 Remove env**

```
$ conda remove --name <env_name> --all
```

## VIRTUAL ENV

### 10.1 Installation

```
$ pip install virtualenv
```

### 10.2 Create virtual environment

Create with specific python version

```
$ virtualenv -p python3 myvenv
```

### 10.3 Activate environment

```
$ source myvenv/bin/activate
```

### 10.4 Deactivate the environment

```
$ deactivate
```

## TMUX

`tmux` is a terminal multiplexer: it enables a number of terminals to be created, accessed, and controlled from a single screen. `tmux` may be detached from a screen and continue running in the background, then later reattached.

### 11.1 Installation

```
$ sudo apt-get install tmux
```

### 11.2 List available sessions

```
$ tmux ls
```

### 11.3 Start new session

```
$ tmux new -s <session_name>
```

### 11.4 Attach to session

```
$ tmux a -t <session_name>
```

### 11.5 Kill session

```
$ tmux kill-session -t <session_name>
```

SSH File Transfer Protocol, a network protocol used for secure file transfer over secure shell.

## 12.1 Login to server

Login to user home directory of the server.

```
$ sftp <user_name>@<server_ip>
```

Login to specific directory of the server.

```
$ sftp <user_name>@<server_ip>:<remote_dir>
```

## 12.2 File transfer

Download file from server.

```
$ get <server_path> <local_path>
```

Upload local file to server.

```
$ put <local_path> <server_path>
```

## 12.3 Command

Command for local host.

```
$ !<command>
```

Command for server.

```
$ <command>
```

## 12.4 Exit server

Exit from server.

```
$ bye
```

## **13.1 Restart**

```
$ service apache2 restart
```

## **13.2 Check error log**

```
$ tail -n 20 /var/log/apache2/error.log
```

## ABOUT FUC-CHEN

Frequently Used Commands for CHEN ([FUC-CHEN](#)) is a collection of most FUCs used in daily coding. Please consider *star* this repo if it helps you.
